

Sprint 3 Schedule Report

Network Diagram:

Scrum Task Titles:

To provide clarity on the tasks referenced in this report, below are the key Scrum tasks and their descriptions:

- **SCRUM-51:** Integrate OCR for uploaded receipts
- **SCRUM-52:** Update receipt structure to support tax and tip
- **SCRUM-53:** Implement automated tax and tip calculations
- **SCRUM-54:** Apply standardized UI theme from Figma
- **SCRUM-55:** Create unified dialog component for data entry
- **SCRUM-57:** Integrate secure user authentication

- **SCRUM-58:** Implement logout functionality
- **SCRUM-59:** Add update and delete operations for group management
- **SCRUM-60:** Enable billing info updates for subscriptions
- **SCRUM-61:** Implement delete for receipts, groups, and subscriptions
- **SCRUM-62:** Final touch-ups and UI refinement

Critical Path Explanation:

The **Critical Path for Sprint 3** is:

SCRUM-57 → SCRUM-51 → SCRUM-52 → SCRUM-53

This sequence was central to delivering the core feature of secure, automated receipt management. Authentication (**SCRUM-57**) was essential before allowing OCR uploads (**SCRUM-51**), which in turn needed the receipt structure (**SCRUM-52**) and calculation logic (**SCRUM-53**) to be in place. Any delays in these tasks would have impacted overall sprint success.

Keeping Sprint on Schedule:

To ensure Sprint 3 remained on track, we took the following steps:

- **Planned around midterms:** We scheduled low-dependency tasks and planning sessions in the first week while team members focused on exams.
- **Focused delivery window:** The majority of critical feature development was scheduled for March 17–21, post-midterms.
- **Parallel work:** UI tasks (e.g., **SCRUM-54**, **SCRUM-55**) progressed independently of backend-critical features.
- **Clear task dependencies:** Critical path items were prioritized in sprint planning to reduce bottlenecks.

Sprint Outcome & Lessons Learned:

- **Successful Completion:** 26 out of 32 story points were completed by the sprint's end, with key features like authentication, OCR integration, and UI unification delivered.
- **Learning to Sequence Work Smarter:** We learned the value of assigning lower-dependency or design-focused tasks (like UI components and styling) earlier in the sprint during academically busy periods. This helped maintain continuous progress even with limited availability.
